the statement: the commutant $GL(1, D)$ coincides with $SL(1, D)$. For $SU(\phi)$ everything is also reduced to a certain hypothesis on the structure of a body D with involution.

At the present time the hypothesis for $SL(n, D)$ has been proved for p-adic fields and algebraic number fields, the hypothesis for $SU(\phi)$ only for p-adic fields. The purpose of the article is to prove the hypothesis for any global fields. The fundamental theorem is: Over global field K the group $SU(\phi) = TU(\phi)$ i.e., is generated by transvections and is the commutant of the group $U(\phi)$. The proof of this theorem essentially depends on proving the hypothesis for $SL(n, D)$. In particular, the hypothesis for $SL(n, D)$ must be proved for a functional global field. This is done by a slight modification of WANG's reasoning, using the theory of class fields for functional fields.

"Detection of Fast Electrons in Plasmoid Injection into a Transverse Magnetic Field"

Moscow, Pis'ma v Zhurnal Èksperimental'noy i Teoreticheskoy Fiziki, Vol. 15,
No. 1, 5 Jan 72, pp 7-9

Abstract: Fast electrons observed in the injection of a plasmoid into a transverse magnetic field are described. The experiments were conducted on the INYeS device described by Golovin, et al, at the IV International Conference on Plasma Physics and Thermonuclear Research at Madison in June 1971. It is noted that when a plasmoid enters a transverse magnetic field, there should occur a redistribution of energy between the ion and electron components, as has been discussed theoretically by many authors using a one-dimensional model of an equilibrium boundary layer between the plasma and the magnetic field. In this model the plasma flow incident on the magnetic field is reflected as a whole from the "magnetic wall" and acceleration of electrons and slowing down of ions occurs in the transition layer formed due to separation of the

charges. Upon injection of the plasmoid into the magnetic field there was recorded x-radiation with an energy of the order of the energy of the incident protons. The radiation was recorded by a scintillation detector from the central region of the trap. Oscillograms of the x-radiation are shown for different magnetic field strengths. The intensity of the radiation increased with an increase in the field strength from 1 to 2.5 koe. In the absence of a magnetic field the radiation was never observed. A first narrow radiation peak on the time scale corresponds to the time of input of the plasmoid into the magnetic field. A second, wider peak arises simultaneously with the beginning of radiation of the spectral line of copper CuI,-- i.e., at the time of entry of the plasmoid into the trap from the plasma gun -- for a plasmoid moving with a velocity of $3 \cdot 10^6$ cm/sec and containing a large number of impurities. Electromagnetic radiation in the range 4.6-0.8 cm was recorded simultaneously with the x-radiation; as in the case of radiation, it was never observed in the absence of a transverse magnetic field, and its intensity increased with an increase in the field strength. The intensive radiation in the range of characteristic plasma frequencies and their harmonics indicates

the existence of a plasma with a high level of oscillations in the trap. A second pulse of x-radiation indicates the presence of high-energy electrons held in the trap. The study indicates that a considerable number of electrons acquire energy and are captured in the trap upon the entry of a fast plasmoid into a transverse magnetic field. The authors conclude that it remains unclear as to what serves as the target for the slowing down of fast electrons responsible for the appearance of the first x-radiation peak and that the experimental results cannot be fully explained within the framework of the aforementioned one-dimensional model.

"Infrared Spectra of the OH Groups on the Surfaces of Oxides"

Uspekhi Fotoniki [The Successes of Photonics -- Collection of Works], No 2, Leningrad University Press, 1971, pp 92-129 (Translated from Referativnyy Zhurnal, Khimiya, No 3, 1972, Abstract No 3 B1505 by S. Grigorovich).

Translation: This review is dedicated to the IR spectra of the OH groups on the surfaces of the oxides of Be, Mg, Ca, Zn, Y, Al, Ga, In, Ti, Zr, Hf, Th, Si, Ge, Ta and Ni. Primary attention is given to the following problems: 1) detection and clarification of the specifics of the structure of the hydroxyl cover on the oxides; 2) conditions of removal of water adsorbed in molecular form from the surface and conditions of dehydroxylation of the surface; 3) interaction of OH groups with physically adsorbed molecules.

Metody Opredeleniya Autoantitel i ikh Sravnitel'naya Otsenka (Methods of Determining Autoantibodies and Their Comparative Evaluation), Tashkent, "Meditina," 1971, 112 pp

Translation: Annotation: Successful development of research to study the role of autoimmune processes in the pathogenesis of diseases is linked first of all to developing simple, sensitive methods of detecting autoantibodies. A large number of reactions are suggested, many of which are cumbersome labor-consuming, and abound in errors, while some of them are not sufficiently sensitive. Antigens prepared by various methods are employed to detect autoantibodies. The frequency of detection of autoantibodies during the same illness differs according to different authors. For this reason it became necessary to generalize, systematize, and make a comparative evaluation of the methods, descriptions of which are scattered in numerous periodicals.

Modern methods of detecting autoantibodies are presented in the monograph and a comparative evaluation of the methods is given.

"Thermodynamics of Ejection Processes"

Tr. Vses. nauchno-tekhn. konferentsii po termodinamike. Leningr. tekhnol. in-t kholodiln. prom-sti (Works of the All-Union Scientific and Technical Conference on Thermodynamics. Leningrad Technological Institute of the Refrigeration Industry), Leningrad, 1970, pp 129-137 (from RZh-Mekhanika, No 11, Nov 70, Abstract No 11B516)

Translation: This article contains a general thermodynamic analysis of the mixing process in an ejector. It is demonstrated that the ordinary structural design of ejection equipment with an active nozzle at a significant distance from the mixing chamber is not always expedient. A procedure is proposed for calculating low-head ejectors based on use of hydraulic methods. In order to check the proposed calculation procedure, a series of experimental models of an ejector with cylindrical and diffusion mixing chambers was tested. On the basis of the experimental study, an industrial ejection pump was built for supplementing the flue gases when drying fuel with a high moisture content. The calculated study and experiments performed on a model of the equipment demonstrated the expediency

"Parametric Description of Vestibular Nystagmus"

Moscow, Vestnik Otorinolaringologii, No 3, 1973, pp 31-35

Abstract: Based on a mathematical analysis of nystagmograms obtained from 50 subjects, the authors constructed empirical and theoretical curves showing the dynamics of the primary parameters of the nystagmic cycle. Using the methods of differential equations theory, they found the secondary parameters that determine the general patterns of nystagmus as a "stimulus -- reaction" process. Determination of the secondary parameters of vestibular nystagmus is of value in tracing the dynamics of the nystagmic reaction in relation to vestibular function and in diagnosing vestibular disorders. Nystagmus can also be modeled on a computer. By introducing perturbations into the secondary parameters, one can obtain nystagmic reactions with preassigned properties, i.e., artificially create pathological situations and subject them to structural analysis.

"Utilization of Fiberglass Plastics for Agricultural Aviation
Apparatus"

Moscow, Plasticheskiye Massy, Vol 2, 1970, pp 58-59

Abstract: Because of the fact that metallic units used in air spraying of agricultural fertilizers or toxic agents are corrosive, an attempt was made to find more resistant materials. The authors experimented with fiberglass VPS-7, 11-EDSM, EF 32-301, PN-1 materials and with low density polyethylene. As a result of their work, materials were made from fiberglass VPS-7 to assure strength, and plated with low density polyethylene films to give the desired chemical resistance. In this manner reservoirs for chemical agents and the dispersing arms could be manufactured.

"Radiation Diffusion Mechanisms in Metals"

Moscow, Fizika i Khimiya Obrabotki Materialov, No 1, Jan-Feb
70, pp 14-22

Abstract: The authors review existing theories of the radiation amplification of diffusion in metals, on the thesis that currently used models of stationary radiation diffusion as governed by movement of radiation vacancies are not justified. It is demonstrated that in the temperature range where interstitial atoms are mobile and vacancies immobile, the process of radiation diffusion is necessarily nonstationary. Given a constant rate of introduction of radiation defects, the radiation diffusion coefficient will diminish monotonically from the accumulation of vacancies, and in samples where there is a fairly high concentration of constantly active dislocations

"Investigating the Excitation of Oscillatory Levels in $N^{14}H_3$ by Radiation
of a CO₂ Laser"

Moscow, Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, No 3, 1973, pp
771-784

Abstract: The difficulty in the way of developing a precise explanation of the processes leading to the dissociation and chemical reactions of molecules excited by infrared radiation is the result of the paucity of effective methods for investigating the oscillatory state. In this paper, a direct method is developed for studying the population of oscillatory molecule levels from the intensity of the absorption lines in molecular transitions from the oscillatory state to the excited electronic state. Experiments for studying the population change of oscillatory levels in the NH₃ molecule under the excitation of a CO₂ laser are described, and a diagram of the experimental apparatus is given together with an explanation of its operation. The electron-oscillatory transmission spectrum of ammonia in the 2000-2250 Å range with and without the laser is produced. The theory of the phenomenon is developed and its results compared with the experimental results.

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 36, No 2, 1973,
pp 394-399

Abstract: The austenite substructure formed upon hot deformation under conditions of high-temperature thermomechanical treatment, defining the change in the composition of the martensite, is quite stable and is retained for a long period of time after completion of deformation and after secondary heat treatment. Achievement of the optimal combination of mechanical properties as a result of high-temperature Thermomechanical treatment requires that the substructure-formation process develop in such a way that most of the initial high-angle boundaries disappear, so that the entire volume of the metal is filled with subgrains which grow with time. There is a stage of the process (a duration of holding after deformation) such that as the new recrystallized structure is formed by coalescence of subgrains, the old high-angle boundaries disappear completely, while no new high-angle boundaries are yet formed.

Abstract: It is shown to be possible to obtain an approximating kinetic equation in cylindrical geometry by Jacobi polynomial expansion of the angular relation containing two arbitrary parameters. The distribution function and scattering kernel are expanded by polynomials having different parameter values. A multigroup system of equations is obtained. By using Jacobi polynomials for the approximate solution of the kinetic equation written in a modified coordinate system it is possible to describe satisfactorily the space-energy relation of the radiation flux even in the first approximation.

"Nonstationary Method for Measuring Heat Conductivity of Liquids and Gases at High Pressures"

Moscow, Teplofizika vysokikh temperatur, No. 3, May/Jun 72, pp 615-621

Abstract: Nonstationary methods of linear and nontonic heating as methods for measuring the heat conductivity of liquids and gases are discussed since they can determine the temperature dependence of the heat conductivity over a wide temperature range from a single experiment within a relatively short time period. Simple versions of the λ -calorimeter for monotonic heating of liquids proposed by O. A. Krayev in 1960 are examined in particular. An examination of the theoretical basis of the method shows that it is based on the nonlinear theory of heat conductivity and that it is useful for measurements in zones of a sharp change in the thermophysical parameters. A diagram of the proposed λ -calorimeter is shown. The device consists of a hollow metal block and a continuous copper core installed coaxially. The annular gap between them has a constant thickness h and is filled with the substance being tested. A uniformly distributed electric

No. 3, May/Jun 72, pp 615-621

heater is on the surface of the block. An efficient light-weight insulation is used to protect the calorimeter from the medium. Relationships are obtained for developing the optimal structure of the calorimeter unit. The method was checked experimentally in the temperature range 20-400°C at pressures of up to 500 bar. Air, water, water vapor, n-heptane, and n-decane were used as samples. Deviations from tabular curves were no more than 2% over the entire range of working temperatures and pressures. The experiments supported the suitability of the method for studies in zones of a sharp change in the thermophysical parameters of the substance, including direct proximity to the liquid-vapor transition point.

"A Nonstationary Method of Determining Localized Heat Flows"

Leningrad, Izvestiya VUZov, Priborostroyeniye, Vol 15, No 3, 1972, pp 106-109

Abstract: A method of measuring localized heat fluxes is considered which combines simplicity, universality and speed. The method is illustrated by the accompanying figure. The section of the surface of the object to be studied is located in a convective-radiant (gas or liquid) medium and participates simultaneously in convective heat transfer with the medium which circulates directly over it (2) and in radiant heat exchange with external bodies (3) surrounding the object. The temperature field of the medium (2) and the bodies (3) is homogeneous in the general case, and therefore the resultant specific heat flux q_{res} on the surface of the object (1) being studied is a very complex function of many parameters. It is proposed that the heat flux q_{res} be measured by using a thin metal disc (4) with known

specific heat C. The disc is placed parallel to the surface of the object with a gap δ between them. Formulas are given for determining the resultant heat flux and the coefficient of heat exchange between the surface of the object and a nonisothermal medium. Measurements show reasonable agreement with data in the literature. The proposed method can be used to separate the convective and radiant components of the heat flux if two discs are used. Two figures, bibliography of two titles.

"Installation for Studying Heat Physical Properties of Materials in 50-900°C Temperature Interval"

Priborostroyeniye, No 12, 1971, pp 103-107.

ABSTRACT: An installation is described for studying the heat capacity and temperature conductivity of solids with a heat conductivity λ of 2 to 50 w/m-degree. Measurements are performed with smooth heating of a cylindrical specimen. The total measurement error is not over 5-10%. A photograph and schematic diagram of the device are presented. Errors in the measurement of temperature conductivity generally did not exceed 7%. The basic error components are: errors in determination of spacing R (2%), asymmetrical temperature field of the specimen, errors in graphic differentiation (up to 3%), errors in recording by the electronic potentiometer (1-2%) and others. The author's particularly note the errors developing in the measurement of θ resulting from the inertia of the R and O thermocouples. These errors can be reduced by placing the specimen over the thermocouples rather tightly, with a clearance not exceeding 0.03 mm.

X11-12. EPITAXIAL LAYERS OF GALLIUM PHOSPHIDE-ARSENIDE OBTAINED BY THE GAS TRANSPORT METHODS

[Article by Ye. N. Vlasovovich, L. F. Plavich, V. M. Andreeva; Moscow: Novosti Druzhby, T.I. Simbirskii po Pretezessii Rotta i Sinteticheskikh Poliimirovannikov, 1972, Izd. I. Plenck, Krasnian, 12-17 June 1972, p 16]

In connection with the broad application of solid solutions of gallium arsenide-phosphide to manufacture instruments for coherent and incoherent radiation, the study of the laws affecting the parameters of the epitaxial structures made of the problem has important significance.... In this paper a study was

In this paper a study was made of the problems of the effect of supersaturation in the investigated systems (Al_{1-x}G_x-HCl and Al_{1-x}P_x-HCl) of gallium on the morphology, chemical composition and growth rate of the epitaxial layers.

Results are presented from a study of the structure and the electrophysical parameters of epitaxial layers ($0 < x < 1$).

The epitaxial layers of GaAs_{0.6}GaP_{0.4} of n-conductivity alloyed with tellurium up to 150 microns thick had a dislocation density in the surface layer of $3 \cdot 10^8 \text{ cm}^{-2}$, Hall mobility of the electrons of $1,500-2,000 \text{ cm}^2/\text{volt}\cdot\text{sec}$ with a concentration of the current carriers of $4 \cdot 10^{15}-6 \cdot 10^{16} \text{ cm}^{-3}$.

sign, where n is the number of terms in the series. Once the coefficients of the series' terms have been determined from this condition, the approximating differential equation is found by substituting the series directly in the approximating equation, equating the coefficients for identical exponents. The errors introduced in the transition from the series to the approximating equation are reduced by changing the arbitrary constants, using a random search technique in the parameter space; i.e., varying each parameter in a randomly selected direction and retaining the change if the function to be minimized is reduced or abandoning it if the function is not reduced.

A block diagram of the algorithm is provided, showing three stages:
1) find the formula for the desired power series; 2) substitute the series in the corresponding differential equation, finding its coefficients by a method which these same authors have previously described in No 5 of this journal for 1969; 3) vary the arbitrary constants, seeking a minimum.

"Possibilities for the Logical Design of Digital Meters by the Method of Inertial Semi-Automatic Devices"

Riga, Izvestiya Akademii Nauk Latvskoy SSR, No 2, 1970, pp 97-102

Abstract: A formal procedure is described for the design of digital measuring devices. In contrast to the models of Moore and Moore-Mill, the components are described as inertial semi-automatic devices, less sensitive to impulse noise than impulse-potential elements and less sensitive to the parameters of the signals measured, amplitude, duration, and steepness. The technique of formation of all bits in the output code is identical, except for the high- and low-order bits. The example used in an analog-to-digital converter made up of iterative structures.

The basic technique is to represent the control section (comparison section) of this apparatus as a finite automaton, first by state diagrams and then by an eight-state matrix, in which each row represents a state and the values of

1/4

- 113 -

USSR

PLAUME, R. A., and CHAPENKO, V. P., Izvestiya Akademii Nauk Latviskoy SSR,
No 2, 1970, pp 97-102

the elements in this row represent the transitions from this state to other states. This state matrix is then reduced to a matrix containing no degenerate or competitive relationships between states, by a method attributed to Yakubaytis, Gobzemis, and Fritsnovich in No 5 of the journal Avtomatika i Vychislitel'naya Tekhnika for 1967. Further simplifications are achieved by the introduction of functional connections and the combination of intermediate states, by a technique also attributed to Yakubaytis and described in the same issue of the same journal.

The present article introduces a modification of this algorithm, since the difficulty of establishing iterative relationships among the various functional connections makes it difficult to use. The modified algorithm does not guarantee the absolute minimum number of intermediate variables; however, it produces iterative structures on the basis of determined rules. An example of this procedure is given for the analog-to-digital converter control circuit described. The steps are: 1) find the row corresponding to the initial state; 2) insert 1's in the indeterminate transitions and exclude the intermediate variable corresponding to this state as unitary; 3) find the intermediate states

2/4

USSR

PLAUME, R. A., and CHAPENKO, V. P., Izvestiya Akademii Nauk Ukrainskoy SSR,
No 2, 1970, pp 97-102

corresponding to each of the possible states of the output bits (in the example there are three bits and eight states); 4) find the inverse relationships expressing each bit in terms of some combination of states; 5) interchanging the columns, obtain a shorter code for the internal states, in which the first eight states are replaced by the low-order three-bit values.

As this process is repeated, internal states which appear only in combination are isolated and replaced by single states, until the number of such states has been reduced to a relative minimum. The result is a shorter code than the initial code. This is converted to hardware by replacing each bit in the code with a negative feed-back circuit; to ensure the inertial character of the circuits, filters are included in them.

The authors report that several instruments have been designed by this method and that the majority of them are comparable in complexity to available instruments and less sensitive to input noise. The fact that they are constructed

from iterative structures substantially reduces the development time, since only minor changes need to be made for the high- and low-order bits.

"The Effect of High-Temperature Thermomechanical Treatment on Hydrogen Embrittlement of Steels"

Moscow, Fizika i Khimiya Obrabotki Materialov, No 3, May-Jun 71, pp 54-58

Abstract: The tendency of steels D and 36G2S to hydrogen embrittlement after high-temperature thermomechanical treatment (HTTT) and control thermal treatment (by the same method, but without squeezing) was investigated. The HTTT of steels reduces their tendency to hydrogen embrittlement, if compared with the control thermal treatment. The main source of this reduction is the uniform distribution of dislocations in the volume of the metal (lower stress concentration), which, on the one hand, decreases the tendency of the steel to a brittle breakdown and, on the other hand, reduces the hydrogen absorption of steel. The possibility of a braking effect of the growth of martensitic plates, having a high dispersibility, is indicated. The latter factor decreases the distortion of near-boundary volumes which are the main locations of embrittlement. Four figures, one table, two bibliographic references.

"The Effect of Alloying Elements on the Corrosion Behavior of Titanium"

Moscow, Zashchita Metallov, Vol 9, No 1, Jan-Feb 73, pp 10-15

Abstract: The method of potentiostatic polarization curves, corrosion tests, and electron diffraction investigations were applied to investigate the corrosion and electrochemical properties of alloys based on titanium iodide with small additions of chromium, molybdenum, niobium, aluminum, manganese, and tin in a 40% H_2SO_4 solution at 80° under natural aeration, conditions.

The structure of the anodic oxide films developing on these alloys was analyzed. The passivation and full passivation potentials were found to be practically independent of the nature and concentration of the alloying addition, whereas the critical passivation currents and the currents in the passive zone varied significantly. Aluminum impairs the corrosion properties of titanium both in the active and passive states. Manganese and chromium increase the rate of corrosion in the active state and decrease it in the passive state. Niobium, on the other hand, reduces titanium corrosion rate in the active state and increases it in the passive state. One figure, three tables, thirteen bibliographic references,

"Structural Study of Surface Layer on Ti-Pd Alloys"

Moscow, Zashchita Metallov, Vol 8, No 3, May-Jun 72, pp 291-294

Abstract: The article describes results of an electron microscopic, electron diffraction, and X-ray study of the surface layer forming on Ti-Pd alloy (Ti-0.2 percent Pd and Ti-1 percent Pd) during corrosion in 40 percent H_2SO_4 and 20 percent HCl at 100°. The electron microscopic study of the surface of Ti-Pd alloys after their corrosion confirms the supposition as to the accumulation of palladium on the surface in the form of very finely dispersed crystalline formations. After treatment of the surface with hot concentrated HNO_3 , which dissolves Pd, the electron microphotographs show no particles. In the case of Ti-1 percent Pd palladium mainly forms very fine particles on the surface. The Pd accumulations on Ti-0.2 percent Pd alloy reveal a tendency towards the branched growth of primary crystallization centers.

1/3

- 16 -

USSR

TOMASHOV, N. D., et al., Zashchita Metallov, Vol 8, No 3, May-Jun 72, pp 291-
294

The results of the electron diffraction study of the surface of Ti-1 percent Pd alloy show that after corrosion in 20 percent HCl at 100° there are strong lines characteristic of Pd and very weak lines characteristic of TiO₂ and TiH₂. After treatment of the alloy in HNO₃ the lines characteristic of Pd disappear, and only TiH₂ and TiO₂ are found on the surface. The relative intensity of the reflections characteristic of Pd increases with an increase in the corrosion time, while it decreases for TiH₂ and TiO₂. After corrosion in 40 percent H₂SO₄ at 100° reflections characteristic of Pd, TiH₂, and TiO₂ are observed. However, the intensity of the Pd-characteristic lines is considerably weaker than after corrosion in 20 percent HCl at 100°, and they are of a diffuse character, while the intensity of the reflections characteristic of TiH₂ and TiO₂ is stronger.

X-ray analysis of the powdered surface layer that forms on Ti-1 percent Pd alloy shows that after corrosion in 20 percent HCl at 100° the alloy

"The Effect of Phase Composition of Ti-15% Mo alloys on Its Corrosion Behavior
in the Active State"

Moscow, Zashchita Metallov, Vol 7, No 5, 1971, pp 507-513

Abstract: The corrosion behavior of Ti alloys with 15.1% Mo with a β structure was studied. The alloy was prepared from titanium iodide with the addition of molybdenum, first subjecting it to crucibleless electron-radiation zone smelting. The smelting was carried out in an arc furnace with non-consumed tungsten electrodes in the holes of a water cooled copper tray in an atmosphere of spectrally pure helium. At the same time a control with titanium iodide was run in one of the holes. If the hardness of the titanium as a result of smelting was increased due to gas adsorption much more than 10 units on the Vickers scale, the melt was discarded. The 50 g ingots obtained were forged at 900° into rods and sheets. Finally, after removing the scale and surfaces defects, it was rolled into strips.

Thermal processing of the samples was carried out by heating evacuated and sealed ampules in a muffle furnace for 30 min. at 950° . They were then 1/3

USSR

TOMASHOV, D. N., et al., Zashchita Metallov, Vol 7, No 5, 1971, pp 507-513

transferred to a water bath and fast mixing the ampule was broken. The samples prepared in this fashion had a Vickers hardness H_V of 10/30 - 190.

Before the electrochemical studies, the samples were cleaned with sand-paper, degreased with acetone, washed with distilled water, and dried in a dessicator for not more than 1 day over CaCl_2 . The tests were carried out with natural aeration in 40% sulfuric acid solutions at different temperatures.

Since samples with a β and $\beta + \omega$ structure with a spontaneous natural air oxide film are not activated at temperatures below 65°, and with a $\beta + \alpha$ structure below 70°, a preliminary activation (1 min. in the same acid) of the alloys with a β and $\beta + \omega$ structure at 90° and with a $\beta + \alpha$ structure at 75° was carried out. Without activation the melt remained in the passive state, having a positive stationary potential (e.g., 0.1 v at 80° for alloys β and $\beta + \omega$) and a lower velocity of corrosion ($\sim 0.09 \text{ g/m}^2 \cdot \text{hr}$). After activation the alloy was steadily dissolved in an active state with significant velocity.

A significant effect is shown by the phase composition of Ti - 15% Mo alloy on its corrosion in the activated condition. A much higher corrosion resistance is observed with the single phase β alloy, the least with the two phase $\beta + \alpha$ alloy. This was determined by the much higher resistance 2/3

- 22 -

USSR

TOMASHOV, N. D., et al., Zashchita Metallov, Vol 7, No 5, 1971, pp 507-513

of the β -phase containing, in comparison to the α and ω phases, a higher Mo content. Thus, for maximum increase in the resistance of titanium alloys, alloys with a β -stabilizer (e.g., Mo, Nb, V) it follows that it is possible to apply a thermal processing which will promote the conservation of a single phase β state.

It was also shown that a significant deterioration in the corrosion properties of Ti-Mo alloy occurred in the presence of the metastable ω -phase. In the diffusion of two phase $\beta + \alpha$ and $\beta + \omega$ alloys in the activated state in the region of a potential of 0.260-0.140 v, a concentrated Mo phase accumulates on the surface.

"Corrosion Behavior of Titanium-Molybdenum-Chromium Alloys"

Moscow, Zashchita Metallov, Vol 6, No 5, Sep-Oct 70, pp 499-504

Abstract: This paper deals with the effect of chromium on the corrosion resistance of titanium alloys containing 5 and 10% molybdenum. The electrochemical and corrosion behavior of the alloys was studied by potentiometry, both the current and weight losses being the indicators of the corrosion rate. It has been shown that the β -phase of titanium alloys containing a stable (under the testing conditions) component such as molybdenum, possesses elevated corrosion resistance. In the active dissolution of two-phase $\alpha+\beta$ -alloys of titanium with molybdenum, predominantly the α -phase goes into solution, while the β -phase remains at the surface in the form of a finely disperse layer. In the active

1/2

USSR

TOMASHOV, N. D., et al, Zashchita Metallov, Vol 6, No 5, Sep-Oct 70,
pp 499-504

dissolution in nonoxidizing media, the corrosion rate of Ti-Mo-Cr alloys markedly decreases only on addition of chromium in an amount sufficient for producing single-phase β -alloys (Ti-5Mo-10Cr and Ti-10Mo-10Cr); however, if the alloys have an $\alpha+\beta$ -structure, then the corrosion rate remains about the same (as compared to Ti-Mo alloys). Chromium addition reduces the tendency of alloys to over-passivation, which is caused by the presence of Mo, and the Ti-5Mo-10Cr alloy exhibits the same low corrosion rate within 0.15 to 1.2 v as titanium or Ti-10Cr alloy. At potentials which are more positive than 1.2 v, the corrosion rate of Ti-Mo-Cr alloys begins to increase owing to the tendency of chromium to over-passivation.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE DEPENDENCE OF THE X RAY SMALL ANGLE SCATTERING (SAS) ON THE WATER-GYPSUM RATIO IN HARDENED GYPSUM HAS BEEN STUDIED AS WELL AS THE CHANGE OF SAS DURING HARDENING. THE OBSERVED SAS PATTERNS ARE DETERMINED BY THE TRUE SMALL ANGLE SCATTERING, RATHER THAN BY DIFFRACTION REFLECTION. THE VARIATION OF SAS INTENSITY DURING HARDENING IS ASSOCIATED WITH THE CHANGED PARTICLE SIZE IN THE HARDENING PASTE. FACILITY: INZHENERNO-STROITEL'NYY INSTITUT, GRO'KIY. FACILITY: INSTITUT FIZICHESKOGO KHMII AN SSSR, MOSCOW.

ON THE RELATIONSHIP BETWEEN THE INTENSITY OF
SMALL ANGLE X-RAYS SCATTERING AND THE MECHANISM OF
MOISTURE EVAPORATION FROM HARDENING GYPSUM

M. A. Sorochkin, A. F. Shchurov, G. M. Ponomarenko

Summary

During the investigation of hardening of β -semiaqueous gypsum by means of small angle x-rays scattering (SAS) a change in the intensity of SAS with moisture evaporation from the hardening paste was discovered. The nature of the change in SAS intensity with time has been studied for various water-gypsum ratios at the angles 3, 4, 5, 6 and 20, 25, 30 minutes. The results of the SAS intensity measurements are correlated with the ultrasound velocity. On the basis of experimental data a mechanism is suggested of dehydration of gypsum articles by surface drying, which ultimately increases the strength of the material.

SMALL ANGLE X-RAY SCATTERING
BY WATER-CONTAINING CONDENSATION STRUCTURES OF POLYVINYLFORMAL

G. M. Plavnik, G. M. Sintitsyna, I. N. Vlodavets

Summary

The porosity of the condensation structures of polyvinylformal subjected to treatment with an acetalizing mixture during 6 and 120 hours has been studied by the small angle x-ray scattering method. At maximum water content the scattering intensities of both samples coincide, in this case the porous structure being independent of the acetalation time. After drying the sample subjected to 6 hour acetalation shows practically no porosity. On the contrary, the porosity of the second sample remains unchanged. This indicates that upon prolonged acetalation (120 hours) the structure becomes stable to the capillary contraction forces arising during drying.

"A Device for Monitoring a Locomotive's Transit of Block Section Boundaries"

USSR Authors' Certificate No 297522, Cl. B 61 1 3/20; B 61 1/03, filed 13
Sep 69, published 20 May 71 (from RZh-Avtomatika, Telemekhanika i Vychislitel'
naya Tekhnika, No 1, Jan 72, Abstract No 1A3C3F)

Translation: A device is suggested for monitoring a locomotive's transit of block section boundaries. It contains locomotive pick-up coils connected via a filter to an amplifier input, a rectifier unit whose output is connected to the amplifier output, OR circuits, a flip-flop, and an actuating unit. For purposes of simplification the device contains code separation units, the output of the rectifier unit being connected to the inputs of the code separation units, with the outputs of the code separation units connected to the inputs of the corresponding OR circuits, the outputs of the OR circuits connected to the flip-flop inputs, and the flip-flop output connected to the actuating unit input. 2 illustrations.

"An Amplitude-Time Converter"

Moscow, Otkrytiva, Izobreteniya, Promyshlennyye Obrazetki, Sovarmnyye Znaki, No 5, Feb 72, Author's Certificate No 327584, Division 3, filed 6 Jun 70, published 26 Jan 72, p 165

Translation: This Author's Certificate introduces a nanosecond pulse amplitude-time converter which contains an input emitter-follower, a discharge device, a storage capacitor, a discharge current stabilizer and a pulse shaper. As a distinguishing feature of the patent, the linearity and stability of the conversion factor are improved and the dynamic range of convertible amplitudes is extended by connecting the storage capacitor to the output of the emitter-follower through a series circuit made up of a differentiating stage and a charging device based on a diode-transistor switching circuit. The input of the pulse shaper is connected to the storage capacitor through a series circuit made up of a decoupling stage and a nonlinear differentiating stage.

MORE ON MANAGEMENT OF RURAL PUBLIC HEALTH SERVICES

Article by V.G. Grigor'yev, chief physician of Izhitsa Central Rayon Hospital, Noveosibirskaya Oblast; Novosibirsk, Sovetskoye Zdorov'ye Press, 1973, submitted 13 February 1973, pp. 35-37;

The article by V.G. Grigor'yev [1] and the responses to it [2] prompted us to voice my opinion on the timely issue of rural public health services and of strengthening its administrative link which they discussed.

Our Izhitsky Rayon is the largest in Novosibirskaya Oblast with respect to size of population (20,000 people). The network of its therapeutic institutions includes a central rayon hospital with 300 beds, a 100-bed children's hospital, 30-bed tuberculosis dispensary, 13 health stations in plants, seven district hospitals, 55 field and fielder-ambulante stations, four creches and a child category sanitary epidemiological station. The radius served extends over 80 kilometers. The central rayon hospital is in a city under oblast jurisdiction i.e. it services both urban and rural residents who are about evenly divided.

After the unification of rural and municipal public health services in 1966, it became apparent that management thereof would be difficult. It would be difficult to combine the management of a large central rayon hospital and of other institutions in the city and rural areas. This was confirmed by the experience of the last seven years. But, at the same time, elimination of rayon and municipal public health departments, the merging of rural and municipal public health services had a beneficial effect on the quality of medical care. What was the former rayon hospital? Its capacity was 100 beds. The staff of its four departments numbered 7-8 physicians. And the laboratory was staffed by two intermediate medical workers. Today it is a modern hospital serviced by 70 doctors. It has excellently equipped clinical, biochemical, bacteriological, and serological laboratories where even the most complicated tests are done. The hospital departments are largely therapeutic, surgical, and infectious (for children and adults) which total with 45 beds, a surgical department with 65 beds, traumatology with 50, neurology

"The Accumulation of Deformation and Changes in the Nature of Rupture
of KH18N12T Steel During Thermal Cycling Loading"

Kiev, Problemy Prochnosti, No 2, Feb 74, pp 38-40

Abstract: The change in the nature of rupture of KH18N12T steel during thermal cycling loading is studied as a function of the unidirectional accumulation of deformations after various degrees of hardening. It is shown that with preliminary exhaustion of ductility of the material, the probability of brittle fatigue rupture increases.

"Absence of p- π -Resonance in Cyano- and Acylphosphine Vinyllogs"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 10,
Oct 71, p 2355

Abstract: Addition of di-tert-butylphosphine to activated acetylenes gave $(Me_2C)_2PCH_2CHX$ type of compounds, where X = CN (I) or COCOMe (II).

The reaction was highly stereospecific yielding cis-(I) and trans-(II). On the basis of spectral data and because the cis-trans-isomerization did not occur smoothly at 150-200°, it has been concluded that there is no p- π -resonance in these compounds.

"Device for Signal Reception with Equivalent Frequency Spacing"

USSR Author's Certificate No 296221, filed 21 Jul 1969, published 8 Apr 1971
(from RZh-Elektronika, No 1, 1972, Abstract No 1D78P)

Translation: A device is introduced for signal reception with equidistant frequency spacing containing heterodynes and two frequency converters connected in series to it, the input signal to the first of which is fed directly and the input signal to the second of which is fed via a delay line. The device also includes a phase detector one of the inputs of which is connected to the output of the first converter via a band filter. For reception of $3 + 1$ signals with equidistant frequency spacing by one device, for a decrease in distortion, a phase modulator the control input of which is connected to the output of the phase detector is included between the output of the mentioned heterodyne and the other input of the phase detector. The delay of the delay line is selected equal to the inverse of the frequency separation, and the pass band of the band filter is selected not exceeding twice the magnitude of the frequency separation

"Effect of Deformation on Electron Work Function and Exoemission From
Surface of Noble Metals"

Tomsk, Izvestiya Vysshikh Uchebnykh Zavedeniy -- Fizika, No 7, 1970,
pp 37-42

Abstract: The article describes results of a study of regularities in
the exoemission effect in the deformation of noble metals (silver,
gold, platinum, and palladium). Changes in the electron work function
and exoelectronic emission of the metals were studied under various
types of deformation (tension, grinding, polishing). The electron
work function was studied by measuring the contact potential differ-
ence by the dynamic capacitor method. The results indicate that plas-
tic deformation due to surface tension and machining is accompanied by
a decrease in the electron work function. This means that there is a

MINTS, R. I., et al., Izvestiya Vysshikh Uchebnykh Zavedeniy --
Fizika, No 7, 1970, pp 37-42

decline in the potential barrier value and an increase in the probability of electron emission. This effect manifests itself in the appearance of exoelectronic emission, the intensity of which depends on the degree of deformation. Simultaneous measurement of these quantities makes it possible to establish the interrelationship between the changes observed in the surface electric properties and disturbance of the surface structure and the physicochemical processes initiated by deformation.

Plekhotkina, M. M.; Krasavina, V. S.; Favorskaya, I. A. (Leningrad Gos. Univ., Leningrad, USSR). Zh. Org. Khim. 1970, 6(1), 45-7 (Russ.). The isomerization of p -XC₆H₄CH(OH)C≡CCMe₃ (I) (X is Cl, H, Me, OMe) to p -XC₆H₄CH₂CHCOOCMe₃ in acid solns. may involve either p -XC₆H₄CH(OH)CH₂C≡CCMe₃ (II) or p -XC₆H₄CH(O⁺H₂)C≡CCMe₃ (IIa). There is only inductive interaction between X and the reactive center in II. In IIa there is, besides inductive interaction, also conjugation between X and O⁺H₂. The exptl. rate data for I isomerization in dioxane-HCOOH showed that IIa is the carbocation species actually formed.

ELECTRIC ACTIVITY OF THE BRAIN IN REVIVAL BY THE METHOD OF ARTIFICIAL CIRCULATION AFTER PROLONGED PERIODS OF ARREST OF THE HEART

V. F. Portnoy, S. I. Plekhotkin, V. A. Chernyak

Chronic experiments were performed on dogs which sustained prolonged clinical death (from 5 to 12 minutes) caused by desanguination. Electric activity of the brain was studied the first 6 to 8 hours from the commencement of revival, and at the remote periods (in 1-3 days, 1, 2, and 9 months). The dogs were revived with the aid of extra-corporeal circulation. In the series with general perfusion the first signs of electrical activity appeared 29.1 ± 2.8 minutes from the beginning of perfusion, and its changed to continuous in 16.2 ± 3.5 minutes. In the series with coronaro-carotid perfusion with subsequent donor circulation the electrical activity appeared in 27.3 ± 1.8 minutes. Its formation into continuous was very rapid, taking 2.6-1.9 minutes on the average. In the majority of experiments EEG was immediately continuous. A frequent rhythm of alpha- and beta-range alternating with the waves of theta- and delta-range dominated in 6 to 8 hours from the commencement of the revival. EEG recorded in dogs 2 to 9 months after the revival failed to differ from the initial, and the animals' behaviour was normal.

THE MECHANISM OF ETHER, BARBITURATE AND EPOINTOL
ANESTHESIA

Darbinyan, T. M.; Golovchinskiy, V. D.; Plekhotkina, S. I.

In experiments on 35 cats the authors studied the influence of intranarcon, ether and epointol on the excitability of the cortex of large hemispheres and reticular formation of the mid-brain. It was found that in intranarcon administration the transcallosal responses changed but little. Inhalation of ether caused an early inhibition of evoked responses in the reticular formation. The thresholds of desynchronization of EEG in electric stimulation of the reticular formation did not change. The marked reduction of the amplitude of transcallosal responses enables to conclude that ether anesthesia is associated with block of the cortex and not the reticular formation. Introduction of epointol caused a less marked inhibition of EEG desynchronization than in the action of intranarcon; reduction of the amplitude of evoked responses did not noticeably differ from that after the administration of iptranarcon. The amplitude

"Electrical Activity of the Brain After Resuscitation by Extracorporeal Circulation Following Prolonged Cardiac Arrest"

Moscow, Patologicheskaya Fiziologiya i Eksperimental'naya Terapiya, No 1, 1970, pp 12-17

Abstract: The bioelectrical activity of the brain was studied in dogs resuscitated by extracorporeal circulation after 5-12 min of cardiac arrest. In a series of experiments with general perfusion, the first signs of electrical activity appeared after 29.1 ± 2.8 min, in the form of low-amplitude slow waves, that gradually became continuous with increasing amplitude and frequency. Within 4-6 hr from the start of resuscitation, the slow theta and delta waves were dominant on the EEG. In another series of experiments with coronary-carotid perfusion, electrical activity appeared after 27.3 ± 1.8 min, becoming continuous within 1.9-2.6 min. Within 6-8 hours the alpha and beta waves were alternating with the theta and delta waves.

"A Delay Line"

USSR Author's Certificate No 269988, filed 9 Feb 66, published 26 Aug 70
(from RZh-Radiotekhnika, No 2, Feb 71, Abstract No 20120 P)

Translation: This Author's Certificate introduces a delay line made in the form of one or more helical springs which work in the torsional vibration mode. The delay line is equipped with input and output converters. In order to improve the interference resistance of the delay line, its input converter is made in the form of a loop of thin current-conducting wire, the two lateral sides being placed between the polepieces of an E-shaped magnet. The output converter is formed by two parallel placed piezoelectric elements fitted with end shoes and connected by a Y-shaped jumper.

"Calculation of Thermoelastic Stresses During Cooling of Stamps at Various Rates"

Tr. Ufim. Aviats. In-t. [Works of Ufim Aviation Institute], 1971, No 25,
pp 111-119, (Translated from Referativnyy Zhurnal, Mekhanika, No 10, 1972,
Abstract No 10 V43, by N. T. Glazunova).

Translation: This article presents results of theoretical and experimental studies of the stress field in heated, hollow, thickwall, long cylinders cooled in various media. Axisymmetrical distribution of temperature in the cross section is assumed. The temperature field along the cylinder is assumed constant. Under these conditions, the temperature and corresponding stress field in the body in the radial direction are described by certain logarithmic rules. For long bodies of rectangular cross section, the author's recommend that the actual contour be replaced by an equivalent cylinder, with the condition of equality of areas of side surfaces. The results of the study are illustrated by graphs of temperature stresses in cylindrical stamps of type 5KhNV steel, cooled in oil and in air. §

"Stereoisomers of Partial Esters of Phenylphosphorous Acid and Their Complexes
With Stannic Chloride"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 8, Aug 73, pp 1692-1696

Abstract: Complexes of partial esters of phenylphosphorous acid with stannic chloride were synthesized yielding $[(RO)C_6H_5P(O)H]_2'SnCl_4$ where R - methyl, ethyl, n-propyl, iso-propyl, and n-butyl. A detailed analysis of IR- and PMR-spectral data was carried out. It was proposed that the stereoisomerism of these complexes is due to different orientation of the phenyl ring plane in the phenylphosphonite with respect to the P-H bond.

"Study of Complexes of Dialkylphosphinous Acids With Tin, Titanium, and
Zirconium Halides"

Abstract: The authors studied reactions of di-n-butylphosphinous, diphenylphosphinous, dicyclohexylphosphinous, di-n-hexylphosphinous, di-n-octylphosphinous acids with tetrachlorides of tin, titanium, and zirconium and with tin tetrabromide. The obtained complexes had an $[R_2P(O)H]_2 \cdot MeX_4$ composition. Their infrared spectra were studied in the 400-4000 cm^{-1} region. The results are shown in a table containing information on 21 complexes.

"Deamination of N,N-Diethylamidoisopropyl Phosphite in a Stannic Chloride Complex"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 2, Feb 73, pp 436-437

Abstract: Reaction of a 1:1 mixture of N,N-diethylamidoisopropyl phosphite and stannic chloride yields a complex -- a viscous colorless product which is stable only at low temperature. At room temperature it breaks down precipitating a white solid of the composition $(C_2H_5)_2NH \cdot SnCl_2$. Evidently a redox process occurs with the elimination of the P-N bond and formation of a secondary amine.

"Electron Effect of an Acceptor on the Rotational Isomers of Certain
Organophosphorus Ligands"

Leningrad, Zhurnal Obshchey Khimii, Vol 41, No 11, Nov 1971, pp 2,576-2,577

Abstract: Infrared and paramagnetic resonance spectral data on several rotational isomers of organophosphorus ligands were obtained. Specifically, the complex $[(\text{CH}_3\text{O})\text{C}_2\text{H}_5\text{F}(\text{O})\text{H}]_2 \cdot \text{SnCl}_4$ exhibited the presence of the 1040, 1060, and 810, 823 cm^{-1} bands, instead of the two bands $\nu_{\text{C}-\text{O}}$ (1030 and 1070 cm^{-1}) and $\nu_{\text{P}-\text{O}}$ (790 and 805 cm^{-1}) in the spectrum of the methyl ester of ethylphosphorous acid, while unexpected doublets appeared in the p. resonance spectrum of the starting ester. The existence of complexes with several different isomers of the methyl ester of ethylphosphorous acid is suggested by the spectral data. Variation in the $^3J(\text{P}-\text{O}-\text{C}-\text{H})$ constants suggests a mesomeric effect in the case of one isomer, owing to its favorable spatial location, with corresponding reduction in length of the $\text{P}-\text{O}$ bond and a certain loosening of the $\text{O}-\text{C}$ bond. Other structural effects are postulated.
